Lab1

A. Tutorial for creating the package and class and running your first Java project on **Eclipse**:

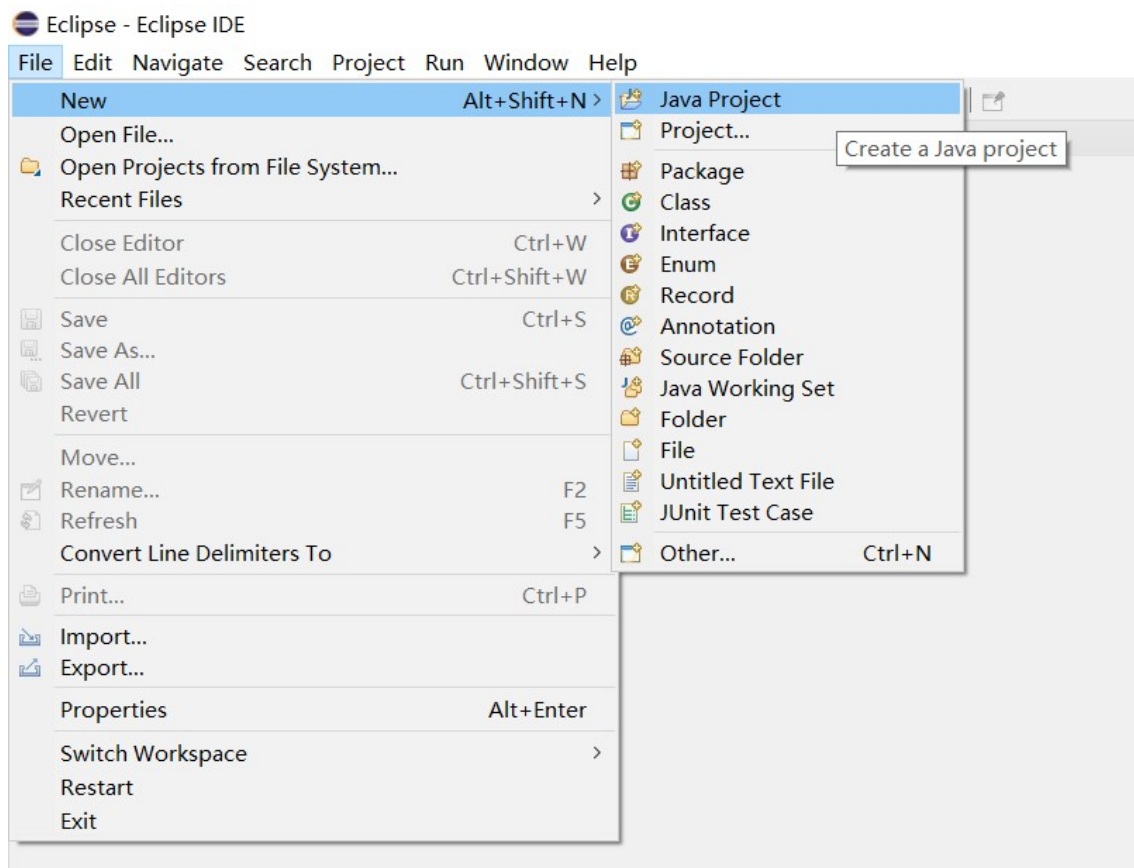

Picking a workspace

The Eclipse IDE prompts you for a workspace to store its configuration. Select an empty directory and click the OK button.

1. Create project

Select File > New > Java project from the menu.

Enter the project name and press the finish button to create the project.

 New Java Project

Create a Java Project

Create a Java project in the workspace or in an external location.

Project name:

☒ Use default location

Location: [Browse...](#)

JRE

☒ Use an execution environment JRE: [Configure JREs...](#)

☐ Use a project specific JRE:

☐ Use default JRE 'jre' and workspace compiler preferences

Project layout

☐ Use project folder as root for sources and class files

☒ Create separate folders for sources and class files [Configure default...](#)

Working sets

☐ Add project to working sets [New...](#)

Working sets: [Select...](#)

Module

☐ Create module-info.java file

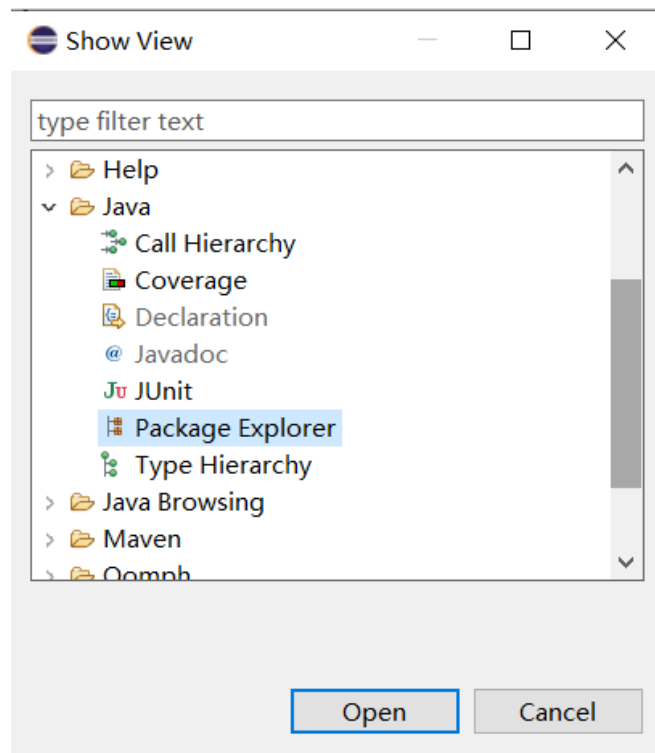

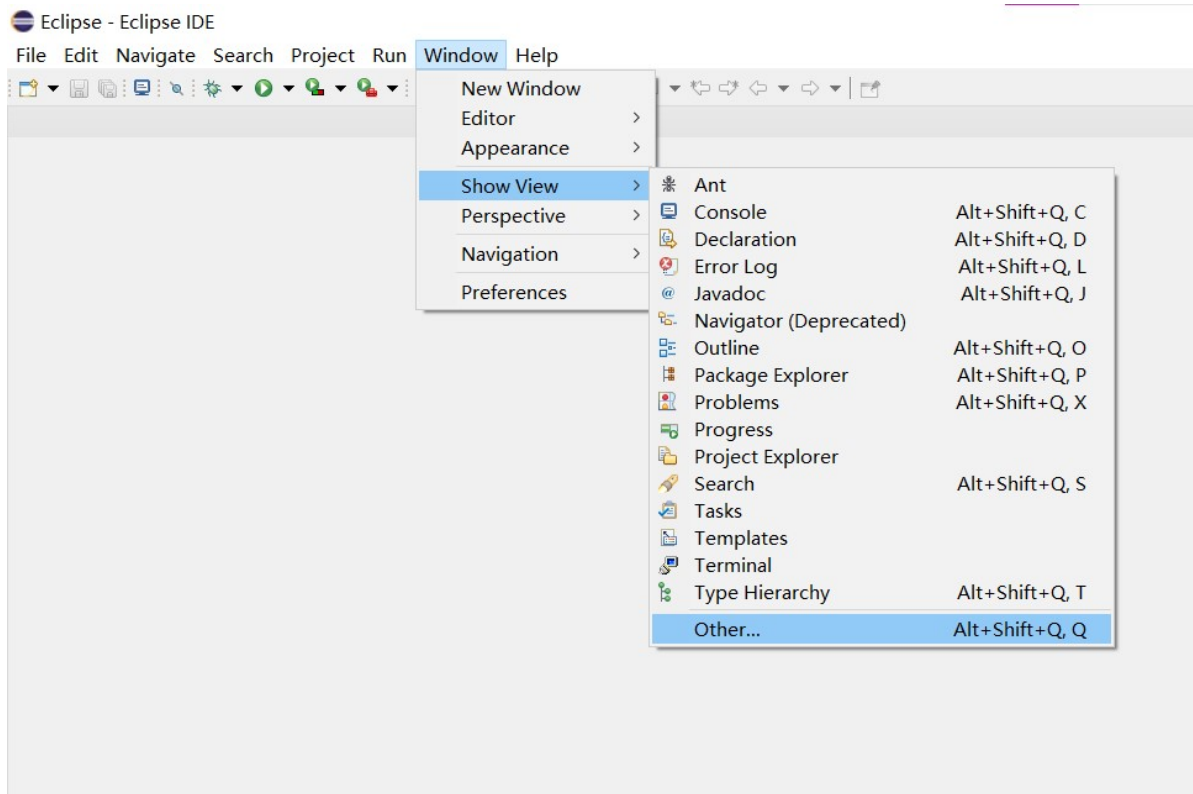

Module name:

☐ Generate comments

[?](#) [< Back](#) [Next >](#) [Finish](#) [Cancel](#)

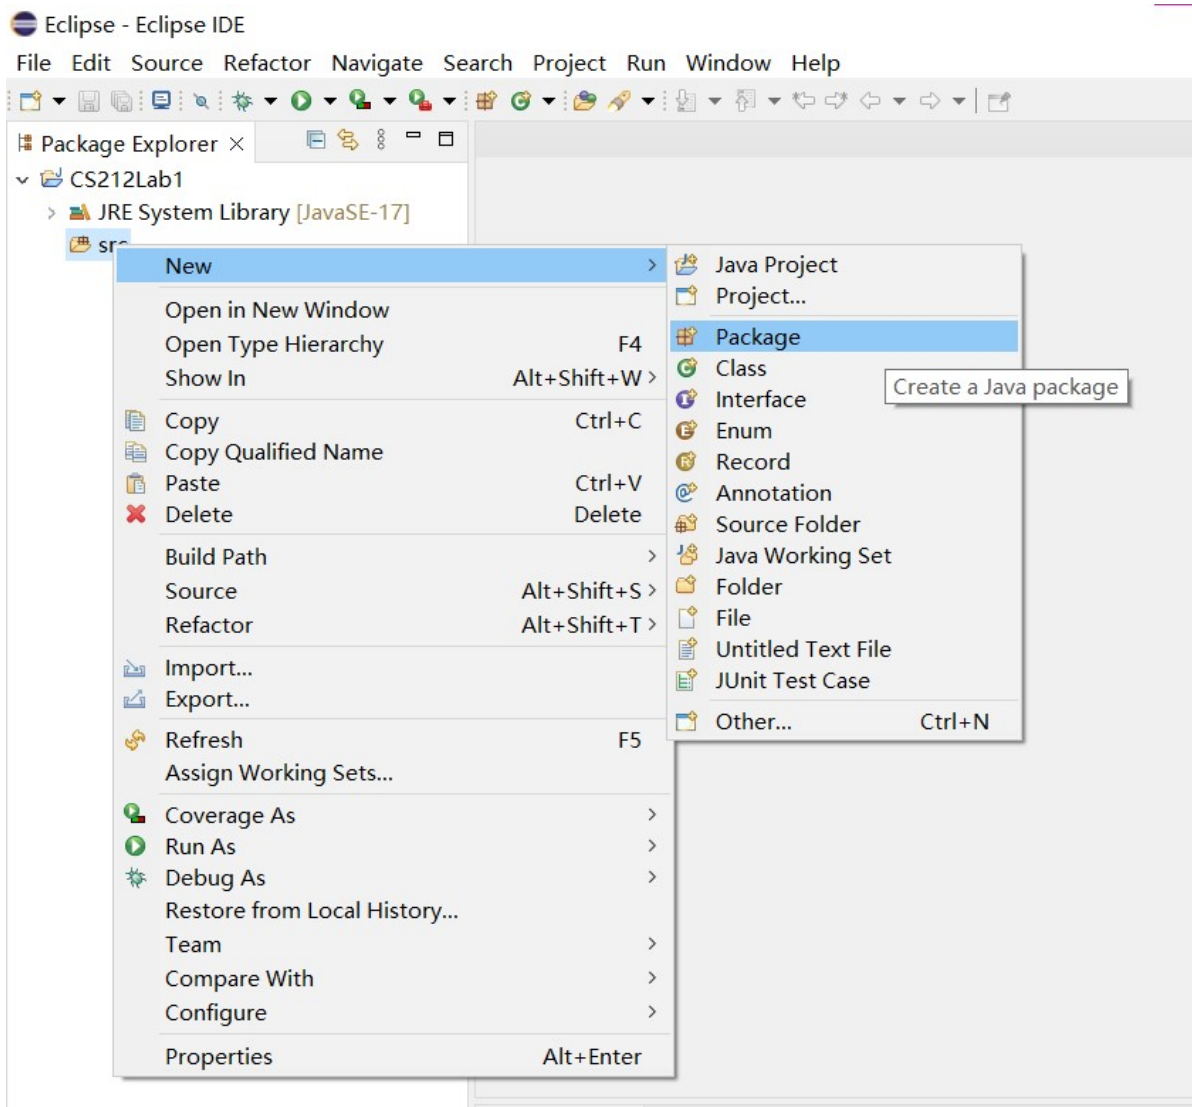

A new project is created and displayed as a folder in your workspace.

After a new project is created, you should see the Package explorer on the left side. If it is not showed, go to Window > Show View > Other > Java > Package explorer, and press Open button.

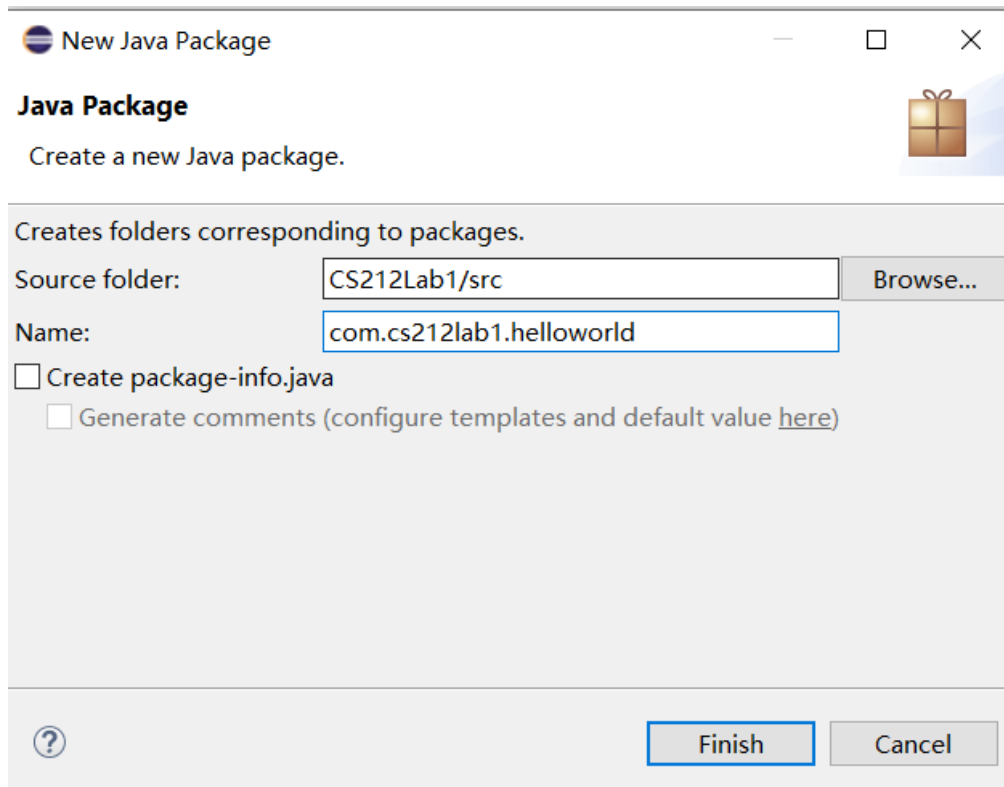

2. Create package

Create the package by selecting the src folder, right-click on it and select New > Package.

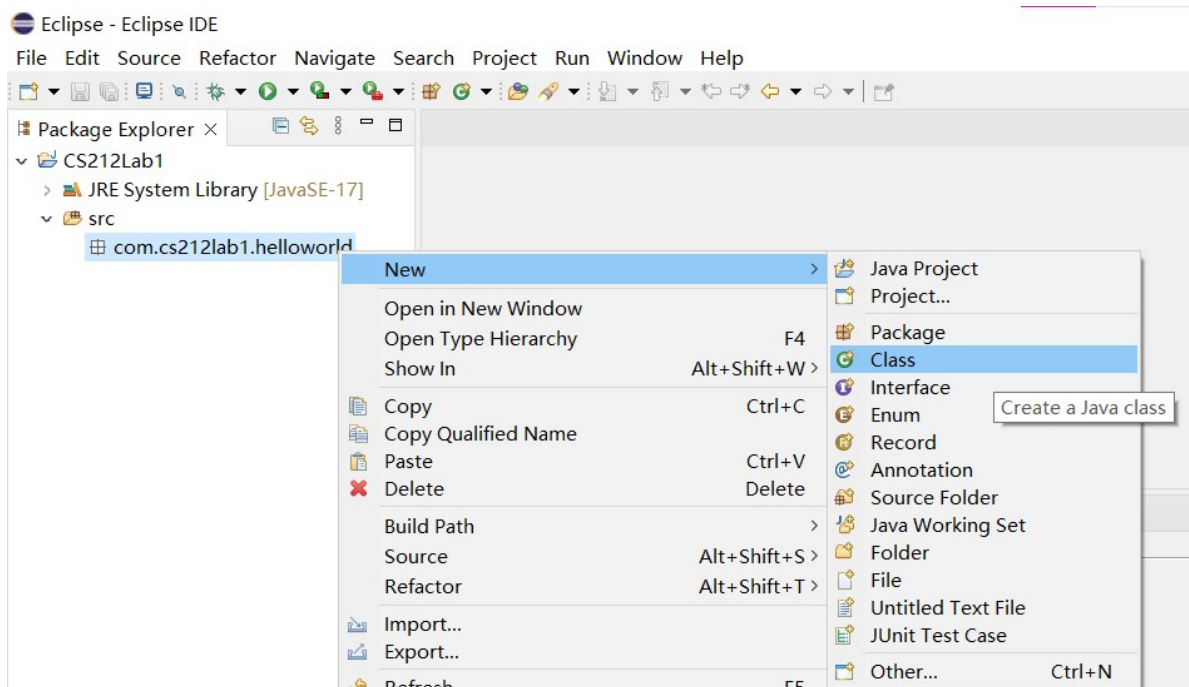

A package in Java is used to group related classes. Think of it as a folder in a file directory. We use packages to avoid name conflicts, and to write a better maintainable code. Packages are divided into two categories:

- Built-in Packages (packages from the Java API): There are many built-in packages such as java, lang, awt, javax, swing, net, io, util, sql etc.
- User-defined Packages (create your own packages): Package names are written in all lower case to avoid conflict with the names of classes or interfaces.

3. Create Java class

Right-click on your package and select New > Class to create a Java class.

Be aware of the Naming Conventions!

*Class names should be nouns, in mixed case with the first letter of each internal word capitalized. Try to keep your class names simple and descriptive. Use whole words-avoid acronyms and abbreviations (unless the abbreviation is much more widely used than the long form, such as URL or HTML).

 New Java Class

Java Class

Create a new Java class.

Source folder:

Package:

☐ Enclosing type:

Name:

Modifiers: ☒ public ☐ package ☐ private ☐ protected
☐ abstract ☐ final ☐ static
☒ none ☐ sealed ☐ non-sealed ☐ final

Superclass:

Interfaces:

Which method stubs would you like to create?

☒ public static void main(String[] args)
☐ Constructors from superclass
☒ Inherited abstract methods

Do you want to add comments? (Configure templates and default value [here](#))
☐ Generate comments

This creates a new file and opens the Java editor. Change the class based on the following Hello World code:

Eclipse - CS212Lab1/src/com/cs212lab1/helloworld/HelloWorld.java - Eclipse IDE

File Edit Source Refactor Navigate Search Project Run Window Help

Package Explorer × 

CS212Lab1

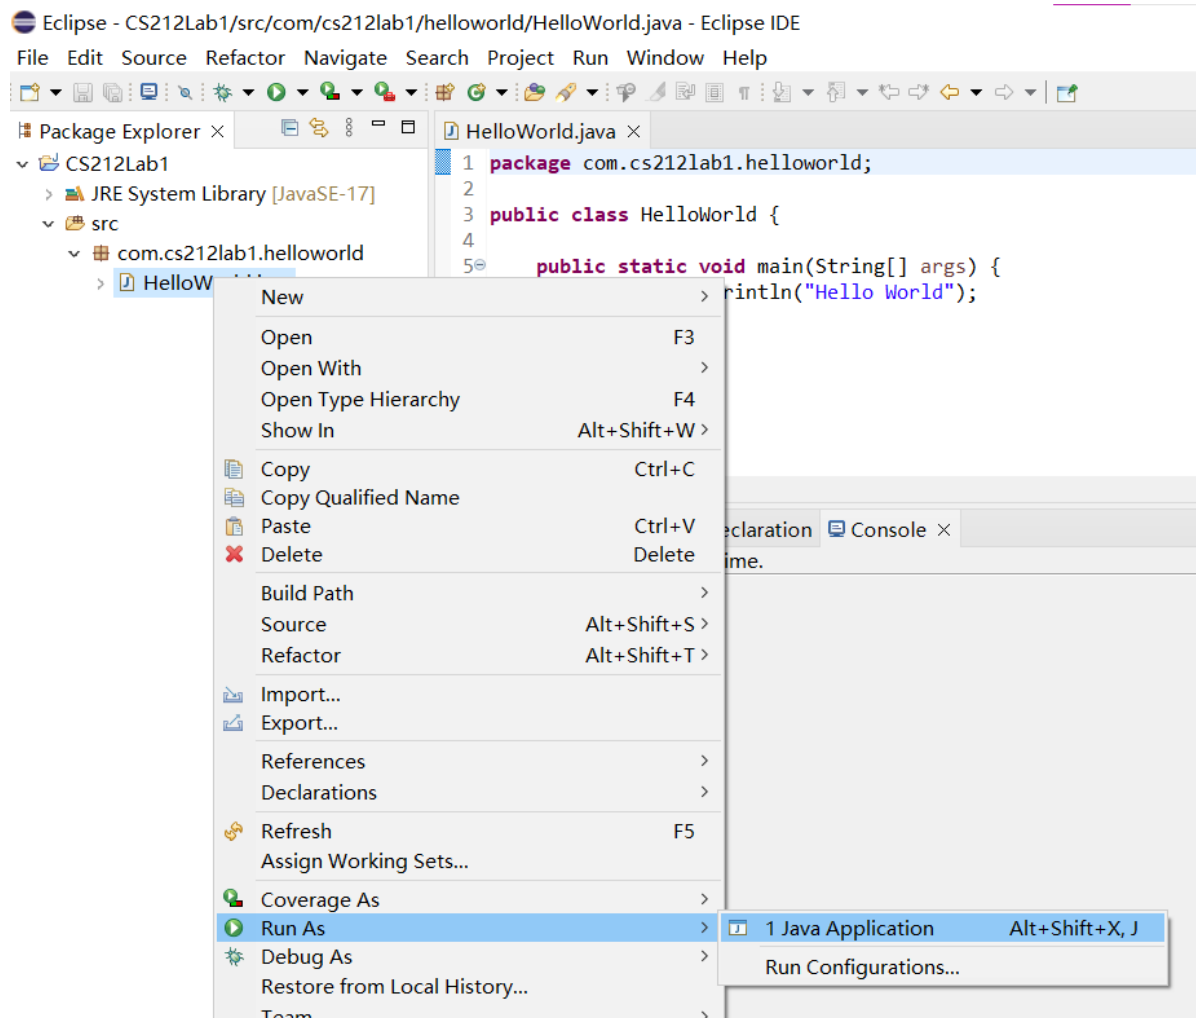

- JRE System Library [JavaSE-17]
- src
 - com.cs212lab1.helloworld
 - HelloWorld.java

HelloWorld.java ×

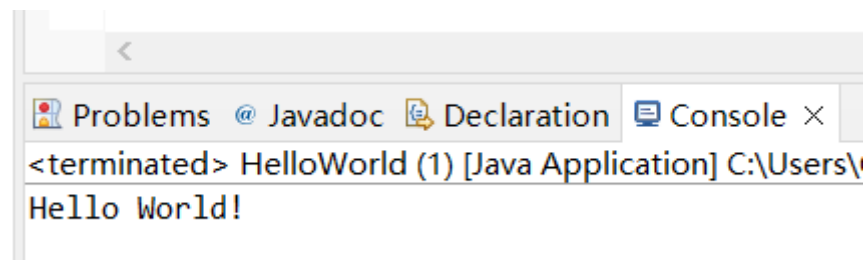

```
1 package com.cs212lab1.helloworld;  
2  
3 public class HelloWorld {  
4  
5     public static void main(String[] args) {  
6         System.out.println("Hello World");  
7     }  
8  
9  
10 }  
11
```

4. Run your application code from the IDE

Save your code before you run it.

Eclipse will run your Java program. You should see the output in the *Console* view if your code is compiled.

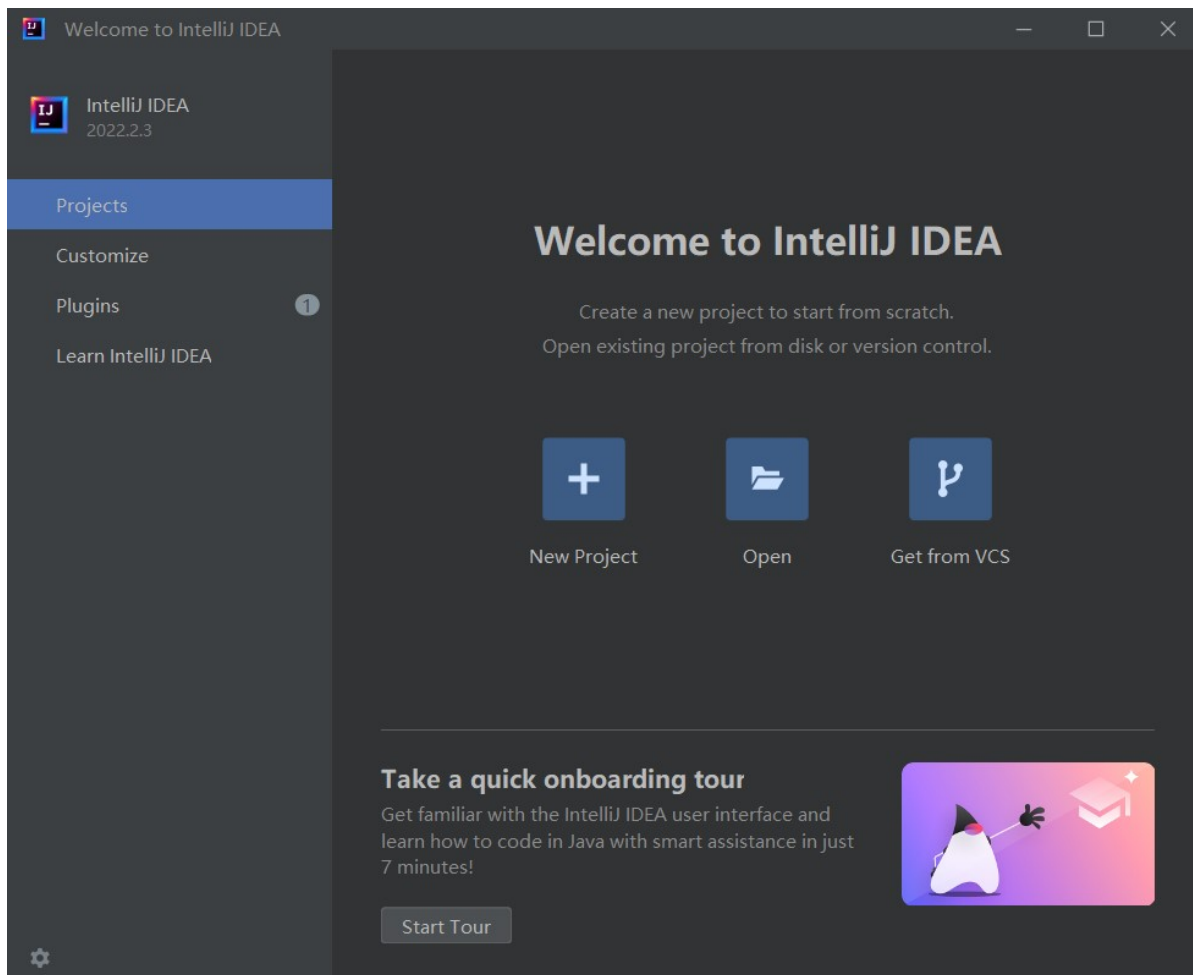

B. Tutorial for creating the package and class and running your first Java project on **IntelliJ IDEA**:

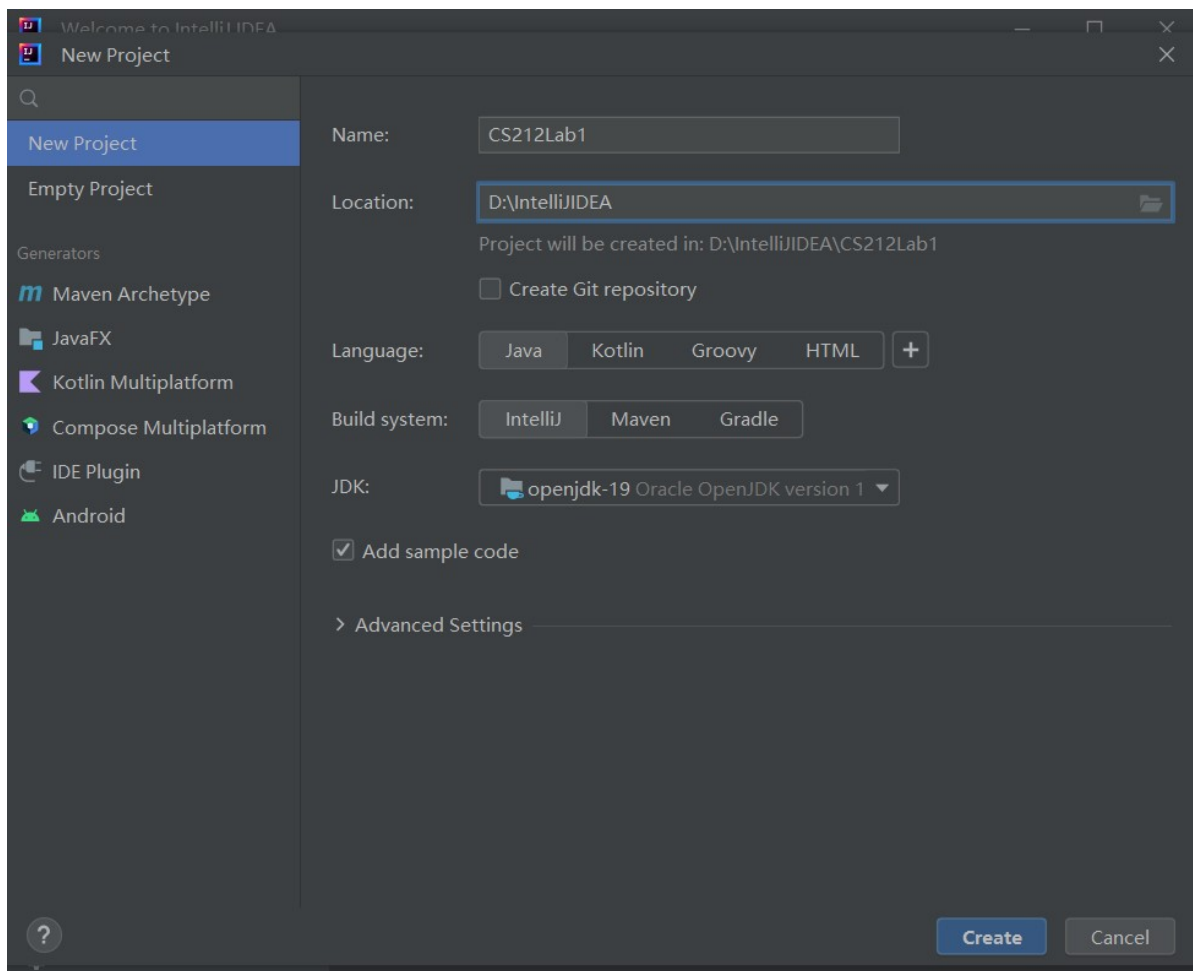

*Use the latest IntelliJ IDEA Community Edition

1. Create project

Click on new project

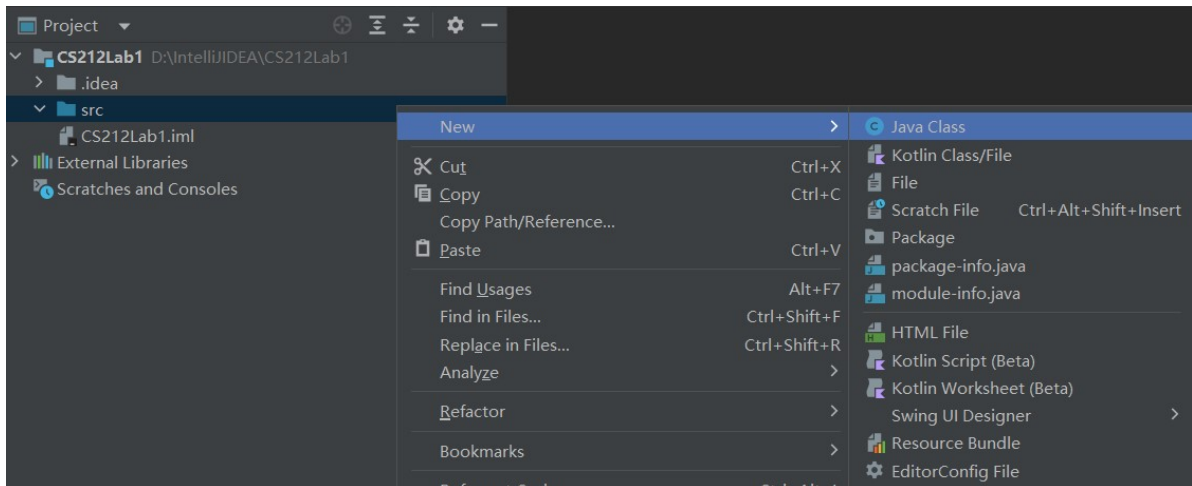

Enter project name and choose project location, press Create button.

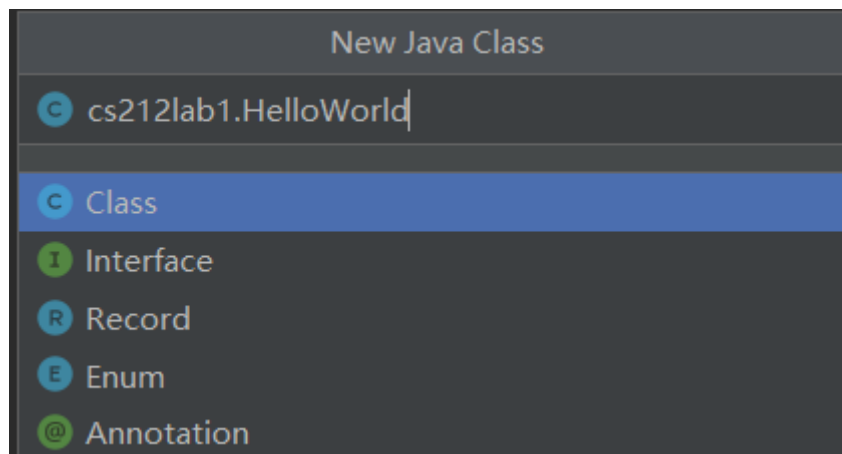

2. Create package and class

Select the src folder, right-click on it and select New > Java Class.

In the Name field, type `PackageName.ClassName` and click OK.

In the example, IntelliJ IDEA will create the `cs212lab1` package and the `HelloWorld` class.

3. Run your application code

You can compile and run classes with the `main()` method right from the editor using the green arrow icon ► in the gutter.
