

CSCI212 Lab — Quiz #5

Full Name:

EMPLID:

Date:

Score:

1. Using **generics**, design a class named **Triple** that implements three generic parameter variables **A**, **B**, **C** and accomplishes/contains the following (all written in the space below, you do not need to align your code with the numbered lines).
 - Stores 3 private attributes of type **A**, **B**, and **C**, each with variable name **a**, **b**, and **c** respectively.
 - A constructor that initializes **a**, **b**, and **c** with the appropriate values from the argument field.
 - A public **getter** method named **get()**, (in this case you would be returning a type **Triple**, just like the one you defined), that returns the 3 attributes corresponding to the object.
 - A public **setter** method, that reassigns the respective attributes with new values provided in the argument field of the method.
 - You do not need to supply comments, the main class/method, or any package/dependency names.
